

A the enrichment map

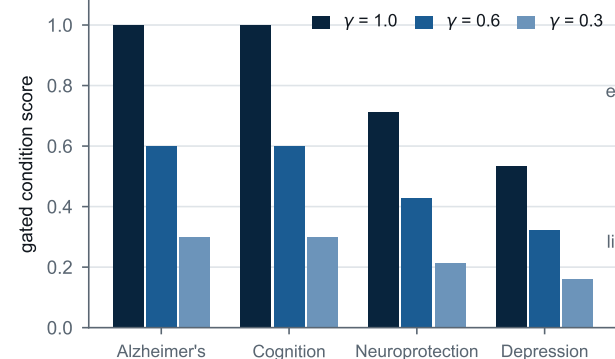

open circle marks the kink at $p = b$; darker curve = higher base rate

B why it is needed here

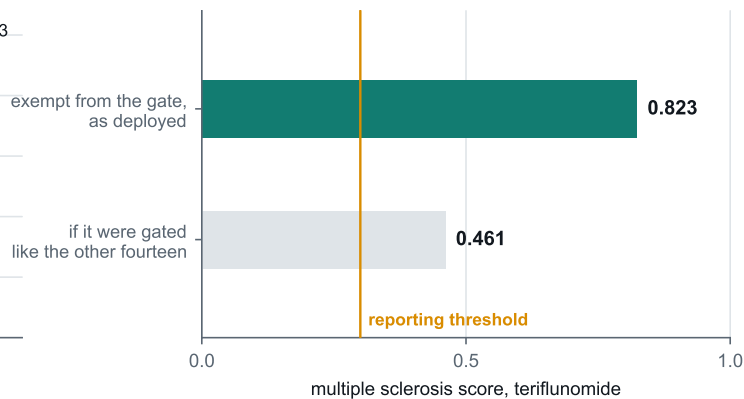

C the gate cannot reorder conditions

the order never changes: a common positive scaling is rank-invariant

D except across the exemption

barrier probability 0.559, so the exemption is worth a factor of 1.79 here.
The gate does reorder a peripheral condition against a central one. No document states this.
