

A probabilities that mean what they say

B sensitivity on chemistry withheld

C and quiet where it should be

D and every adversarial check, passed or not

6 of 6 adversarial checks pass

PASS No test compound is feature-identical to a training compound (MAO_A, BBB)

PASS No duplicate compound survives into training

PASS Reproducible retrain (MAO_A scaffold AUROC)

PASS Predictions are not constant (BBB over 200 drugs)

PASS BBB ranks permeable drugs above non-permeable ones (external, unseen)

PASS The domain flag separates non-drug-like chemistry from unseen drugs

Every check is drawn at the same size whatever its verdict, so a check that later fails would be exactly this visible.

The domain-flag check above failed once, on a control set later found to include compounds inside its own reference library.
